

This can be says as a summary of PCA, how we do it for dimensionality reduction.

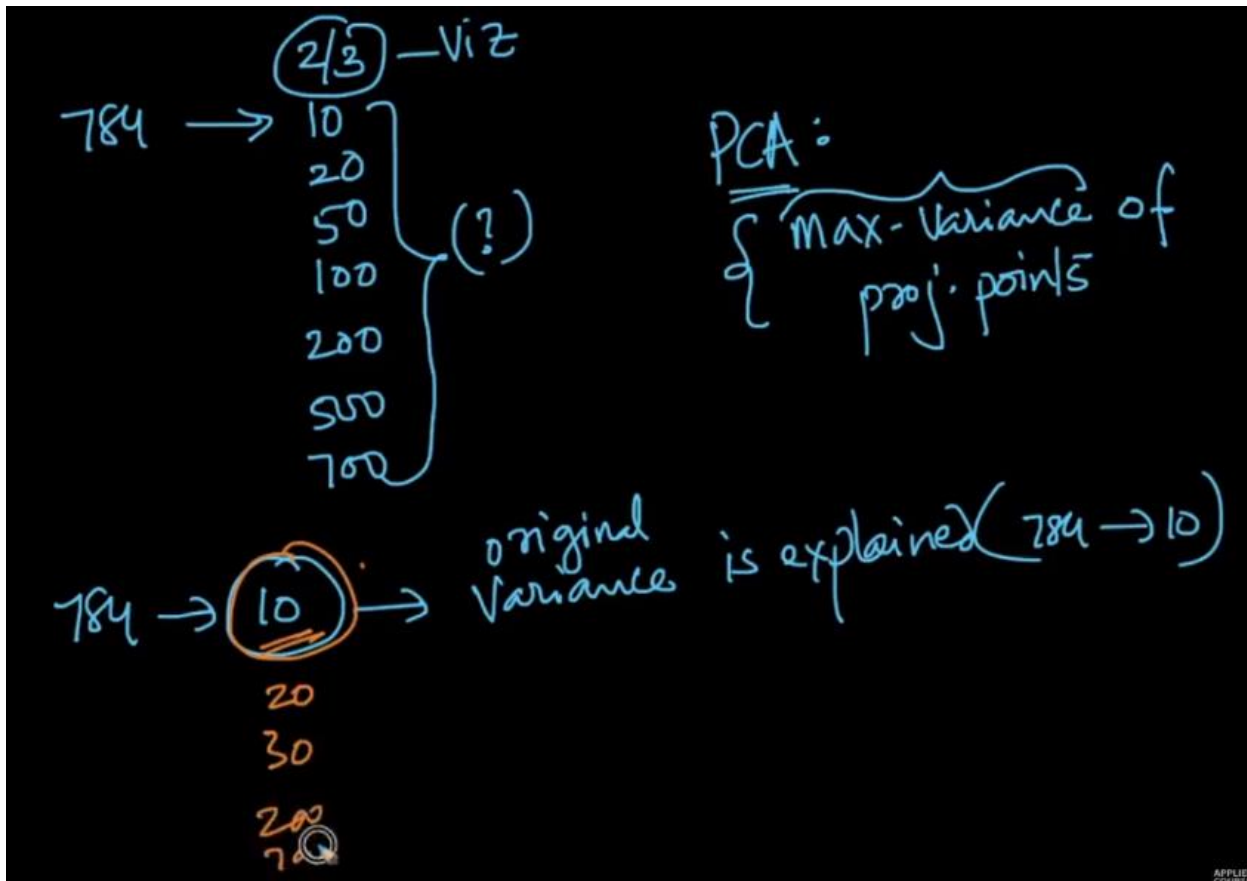

Our ultimate aim is to obtain features  $\mathbf{d}'$  such that  $\mathbf{d}' \leq \mathbf{d}$ , where  $\mathbf{d}$  is original no. of features.

Let's say for mnist where we are obtaining 200 features from 784 features, here we have  $X$  of dimension  $15000 \times 784$  and the eigen vectors matrix of dimension  $784 \times 200$ , which results the final matrix  $X'$  of dimension  $15k \times 200$

So our ultimate aim is to find the no of features for which the information retain percentage is what we want which may be 75%, 99% and how it's calculated is given in below image.

PCA:

$$C = X^T X$$

$784 \times 784$

↓

$$\lambda_i, V_i$$

$$\lambda_1, \lambda_2, \dots, \lambda_{784}$$

$$784 \rightarrow 10 \text{ dim}$$

Percentage of Variance explained in 10-dim

20% of the total variance in 784-dim is explained in 10-dim

$$= \frac{\lambda_1 + \lambda_2 + \dots + \lambda_{10}}{\sum_{i=1}^{784} \lambda_i}$$

# PCA for dimensionality reduction (non-visualization)

pca.n\_components = 784

pca\_data = pca.fit\_transform(sample\_data)

percentage\_var\_explained = pca.explained\_variance\_ / np.sum(pca.explained\_v

cum\_var\_explained = np.cumsum(percentage\_var\_explained)

# Plot the PCA spectrum

plt.figure(1, figsize=(6, 4))

plt.clf()

plt.plot(cum\_var\_explained, linewidth=2)

plt.axis('tight')

plt.grid()

plt.xlabel('n\_components')

plt.ylabel('Cumulative explained variance')

plt.show()

$$\frac{\lambda_i}{\sum \lambda_i} V_i$$

$$\frac{\lambda_1}{\sum \lambda_i}, \frac{\lambda_2}{\sum \lambda_i}, \frac{\lambda_3}{\sum \lambda_i}, \dots$$

$$\frac{\lambda_1}{\sum \lambda_i}, \frac{\lambda_1 + \lambda_2}{\sum \lambda_i}, \frac{\lambda_1 + \lambda_2 + \lambda_3}{\sum \lambda_i}, \dots$$

# If we take 200-dimensions, approx. 90% of variance is explained.

784  $\rightarrow$  100 ( $\sim 75\%$ )  
 $\circlearrowleft$  784  $\rightarrow$   $d'$  ( $\sim \underline{90\%}$ )  
PCA  $\rightarrow$   $\circlearrowleft$  200  
784  $\rightarrow$   $d'$  ( $\sim 95\%$ )  
 $\circlearrowleft$  350

As we can see for 100 components we have 75%, for 200 we have 90% and for 300 components we have 95%.
